MIRROS: Phase 3 trial with time-to-event endpoint, a cure proportion, and a futility interim analysis using response

Kaspar Rufibach

Methods, Collaboration & Outreach Group, Department of Biostatistics, Roche Basel Joint work with Dominik Heinzmann and Annabelle Monnet (Roche, Basel) SMi Adaptive Designs in Clinical Trials Conference London, 2nd April 2019

Agenda

- Acute Myeloid Leukemia
- 2 Clinical development plan
- 3 Key questions of MIRROS
- Implementation features
- 5 Health authority feedback
- 6 Conclusions

Kaspar Rufibach et al. MIRROS 3 / 42

What MIRROS is NOT:

An adaptive trial.

A seamless phase 2/3 trial.

Kaspar Rufibach et al. MIRROS 4 / 42

What MIRROS IS:

A phase 3 trial with a futility interim.

Kaspar Rufibach et al. MIRROS 5 / 42

Acute Myeloid Leukemia

Kaspar Rufibach et al. MIRROS Acute Myeloid Leukemia

Acute Myeloid Leukemia

Rare malignant blood disease.

Most common leukemia, lowest survival rate in adults: $median survival \leq 1y$.

Recurrent life-threatening infections.

Chemotherapy: modest benefit without cure.

Stem cell transplant:

- "Bridge-to-transplant": Goal of any therapy. Needs complete response (CR) to initial therapy.
- Only way to survive AML.

Kaspar Rufibach et al. MIRROS Acute Myeloid Leukemia 7

Standard of care

No standard regimen for relapsed or refractory (R/R) AML. Breems et al. (2005)

No new drug approved for treatment of AML in over 50 years! Bose et al. (2017)

THIS is unmet medical need!

Kaspar Rufibach et al. MIRROS Acute Myeloid Leukemia

Idasanutlin

p53: Tumor suppressor, many mechanisms of anticancer function.

Mouse double minute 2 homolog (MDM2): Negative regulator of p53 tumor suppressor.

Idasanutlin: binds to MDM2 \Rightarrow prevents p53 - MDM2 interaction \Rightarrow (re-)activation of p53 \Rightarrow reinstalls anti-tumor capacity of p53.

Kaspar Rufibach et al. MIRROS Acute Myeloid Leukemia

Clinical development plan

Clinical development plan for Idasanutlin

Need for acceleration:

- Very high unmet medical need in R/R AML.
- Early phase results with Idasanutlin encouraging.
- Competitive landscape and economic constraints: Lean program only way to receive internal approval for pivotal trial.
- Willingness to trade-off risk reduction from randomized P2 against increased speed.

Kaspar Rufibach et al. MIRROS Clinical development plan

Skip or integrate Phase 2?

Assume we have successful P1.

Purpose of futility interim: optimize $P(\text{stopping @ interim} \mid H_0)$.

Hunsberger et al. (2009):

- Integrate P2 into P3: futility interim based on intermediate endpoint.
- Skip P2: futility interim based on P3 primary endpoint.

If trial

- stops at futility interim: basically performed randomized P2.
- passes futility interim: P3 pivotal trial well on its way.

Key advantage of setup: Decision to proceed to full P3 part based on randomized comparison. Parmar et al. (2008)

Kaspar Rufibach et al. MIRROS Clinical development plan

Mirros

MDM2 Idasanutlin in Relapsed Refractory AML for OS.

- Population: R/R AML.
- Comparison: Idasanutlin + cytarabine vs. placebo + cytarabine.
- Phase III, 2:1 randomized, double-blind, placebo-controlled clinical trial.
- Primary endpoint: overall survival.
- Planned recruitment: 374 patients (wild-type sample, + 66 mutant patients).

https://clinicaltrials.gov/ct2/show/NCT02545283

Kaspar Rufibach et al. MIRROS Clinical development plan

Key questions of MIRROS

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Key questions of MIRROS

- Primary endpoint OS. Sample size with cure proportion in both arms?
- 2 Base interim on OS or something else? If the latter, what?
- 4 How to compute operating characteristics of interim analysis?

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Cure proportion model

See e.g. Sun et al. (2018).

Let

- S_i^*, f_i^* : survival and density functions of uncured patients.
- p_i : proportions of patients cured.

Survival and hazard function in each treatment arm ($t \ge 0$):

$$S_i(t) = p_i + (1 - p_i)S_i^*(t),$$

 $h_i(t) = \frac{(1 - p_i)f_i^*(t)}{p_i + (1 - p_i)S_i^*(t)}.$

Ratio of hazard functions:

$$\theta(t) = h_2(t)/h_1(t) = \left(\frac{1-p_2}{1-p_1}\right) \frac{f_2^*(t)}{f_1^*(t)} \left(\frac{p_1+(1-p_1)S_1^*(t)}{p_2+(1-p_2)S_2^*(t)}\right).$$

Even if both S_i^* exponential $\Rightarrow \theta(t)$ depends on time (if ≥ 1 p_i is > 0).

Kaspar Rufibach et al. MIRROS

Cure proportion model – assumptions

What if we ignored cure proportions and simply computed necessary events d using Schoenfeld's formula?

- Study will (typically) be underpowered.
- Time to clinical cutoff will be underestimated.

Control arm, based on historical data, H_0 :

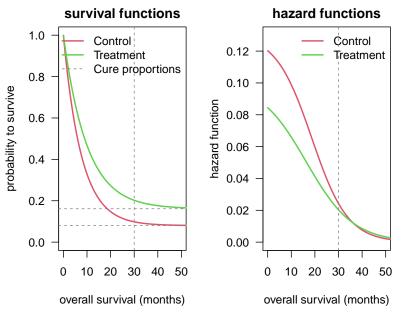

- Median OS 6m.
- Cure: 0.080.

Targeted effect size treatment arm (for 85% power, H_1):

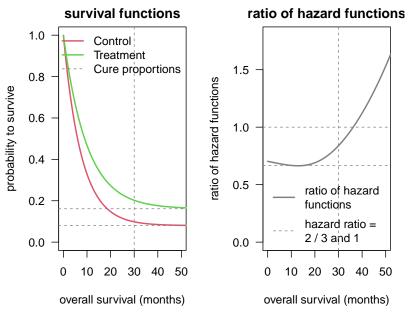

- Median OS 9m
- Cure: 0.161 (see later for justification).

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Cure proportion model – assumptions

Cure proportion model – assumptions

Cure proportion model – sample size

To find sample size:

- Compute necessary events d_0 using Schoenfeld's formula.
- Simulate from assumed S_i 's, compute power for grid of $d = d_0, \ldots, d_1$.
- Choose d such that (unweighted) logrank test gives targeted power.

MIRROS: 2-sided $\alpha=$ 0.05, $\beta=$ 0.15, some accrual and drop-out assumption.

Assumption	$S_1^{-1}(0.5)$	$S_2^{-1}(0.5)$	p_1	p ₂	d	power	time
MIRROS	6.0	9.0	0.080	0.161	275	0.852	38.8
PH, no cure	6.0	9.0	0	0	246	0.858	29.2
MIRROS with	6.0	9.0	0.080	0.161	246	0.810	33.7
#events for PH, no cure							

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Cure proportion model – effect quantification

Cure proportion model - no proportional hazards. Unweighted logrank...

- ...not most powerful test, but loss modest (see above).
- ...still valid test, i.e. protects type I error.

How to quantify effect?

- Kaplan-Meier estimates provide entire information in data.
- Desire to summarize effect in one number.
- Hazard ratio and logrank test: if NPH, estimand depends on censoring distribution!
- Regulatory environment: typically accepted to reject H₀ using valid test, and then quantify effect differently.
- MIRROS: violation of PH only very late. Give hazard ratio, and estimate of cure proportion difference.

Rufibach (2019) has extended discussion in estimand context.

Kaspar Rufibach et al. MIRROS Key questions of MIRROS 21 / 42

Futility interim analysis

Mitigate risk if drug does not work (sufficiently).

Planned after 120 patients are recruited.

Why not use OS for interim decision?

- 53 (under H₀) and 46 deaths (under H₁) expected at interim. Substantial uncertainty.
- Cures have not happened yet at the interim.
- Confounding by early (mainly safety-related) deaths.

Bottom line: interim is too early for OS to be meaningful endpoint.

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Intermediate endpoint

Complete response:

- Sufficiently associated with OS.
- CR necessary for good OS / cure: Patient needs CR to have chance for cure, via bridge-to-transplant.
- Odds ratio as effect measure.

Futility interim is non-binding. Why do we need to model it at all?

- How to choose interim boundary on CR?
- Decision-makers want to be able to trade-off

```
False Positive = P(continue @ interim \mid H_0)
vs.
False Negative = P(stop @ interim \mid H_1).
```

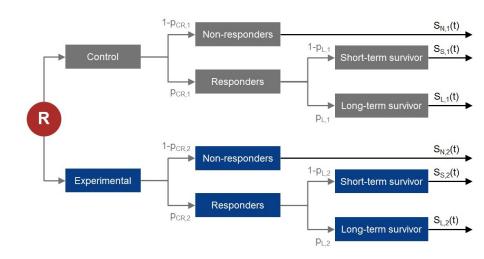

23 / 42

If futility based on $OS \Rightarrow$ conditional power.

If CR is intermediate endpoint: mechanistic simulation model.

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Mechanistic simulation model

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Mechanistic simulation model

Connects CR to OS.

Need to inform all assumptions:

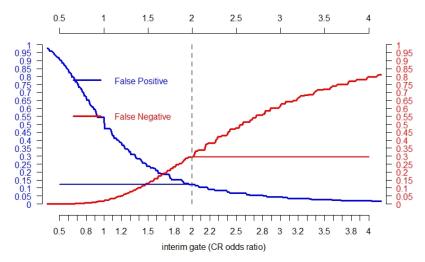

Quantity	Control arm	Treatment arm	
Survival function of non-responders	$S_{N,1}$	$S_{N,2}$	
Probability to have CR	<i>p</i> _{CR,1}	p CR,2	
Probability to be long-term responder CR	$p_{L,1}$	<i>p</i> _{L,2}	
Survival function of short-term responders	$\mathcal{S}_{S,1}$	<i>S</i> _{S,2}	
Survival function of long-term responders	$\mathcal{S}_{L,1}$	$S_{L,2}$	
#patients recruited per month	n_{1j}	n _{2j}	
Months of recruitment	$j=1,\ldots,N$		
Total #patients recruited	$n_1 = \sum_{j=1}^N n_{1j}$	$n_2 = \sum_{j=1}^{N} n_{2j}$	
Drop-out rate per month	$ au_1$	$ au_2$	

Align parameters such that mechanistic simulation model can reproduce sample size!

P(CR) control: 0.16. Assume OR = 2.5 to improve on this with treatment \Rightarrow P(CR tmt) = 0.323. P(longterm survivor) = 0.5. This gives cure proportions.

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Operating characteristics of various interim boundaries

False Positive = P(continue @ interim | no effect)
False Negative = P(stop @ interim | alternative used for powering)

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Operating characteristics of various interim boundaries

Sweet spot: odds ratio of 2,

- False Positive = P(continue @ interim | no effect) $\approx 12\%$,
- False Negative = P(stop @ interim | alternative assumed for powering) $\approx 30\%$.

Interim decision:

- Based on independent data monitoring committee (iDMC) recommendation, i.e. sponsor blinded,
- non-binding,
- included safety criterion (molecule class toxicity) and criteria for early deaths ⇒ OS component.

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Power loss of adding futility interim

Can easily get that from simulations.

- Targeted power: 85%.
- Power taking into account futility interim: 63%!
- Illustrates risk-appetite. Futility interim somehow becomes "informal efficacy interim".
- Do we always compute the power loss when adding futility interims? Do we increase number of events to account for it?

Who cares anyway \Rightarrow interim passed!

Kaspar Rufibach et al. MIRROS Key questions of MIRROS

Implementation features

Kaspar Rufibach et al. MIRROS Implementation features

Implementation features

A (industry) clinical trial is not a pre-specified static undertaking!

- Not clear whether p53 mutant patients (pprox15%) also benefit from Idasanutlin.
 - Still included, as evidence unclear and high unmet medical need.
 - But testing too late for randomization, i.e. could not stratify for p53 status.
 - Adds uncertainty to recruitment assumptions.
- Decision-makers sceptical about interim gate based on CR only. Additionally engineered EFS criterion (not discussed here).

Kaspar Rufibach et al. MIRROS Implementation features

Implementation features

A (industry) clinical trial is not a pre-specified static undertaking!

- Biomarker development: typically in Phase 2! Recommendation on biomarker development by iDMC.
- Seamless designs in general: sponsor does not get to see data for a long time.
 Unease for decision-makers.
- No accrual suspension for interim

 data cleaning and decision needs to come fast.

Kaspar Rufibach et al. MIRROS Implementation features

Health authority feedback

Kaspar Rufibach et al. MIRROS Health authority feedback

Health authority feedback

FDA:

- Preferred randomized P2.
- Challenged lack of stratification on p53 mutation status.
- ullet Companion Diagnostic component with blinded P2 data \Rightarrow not clear how to decide on development.
- Challenged assumptions, asked for additional sensitivity analyses.
- Concerns of early events driving interim analysis. OS not part of futility decision, but early tox deaths are.
- US sites only opened after passing the IA.

EMA:

- Agreed to accelerated development due to high unmet need.
- PH assumption discussed, support hazard ratio as appropriate effect measure.

Kaspar Rufibach et al. MIRROS Health authority feedback 33 / 42

Conclusions

Kaspar Rufibach et al. MIRROS Conclusions 34 / 42

Current status of MIRROS

Interim analysis passed on 17th Sept 2017.

Final analysis cutoff projected for Q4 2019.

Kaspar Rufibach et al. MIRROS Conclusions 35 / 42

Conclusions

- Account for power loss and timing delay if you have cure proportions.
- Think about how to quantify effect.
- Skipping / integrating P2 into P3 allows for acceleration and risk-mitigation. If you stop at interim not much is lost in fact.
- Mechanistic simulation model allows to associate binary intermediate to time-to-event primary endpoint and explore interim analysis operating characteristics

We have implemented this in a REAL trial!

Kaspar Rufibach et al. MIRROS Conclusions 36 / 42

BBS seminar on synthetic controls

Basel Biometric Section spring seminar: Synthetic controls - what do we need and how far can we go?

- Basel.
- May 10th, 2019, 9:00-16:00.
- Speakers from industry, Flatiron, European regulators.
- Rejoinders by regulators: Norbert Benda (BfArM), Jan Müller-Berghaus (PEI), Anja Schiel (Norwegians Medicine Agency & Chair BSWP), Kit Roes (UMC Utrecht MEB and EMA BSWP), Meinhard Kieser (University of Heidelberg).
- Panel discussion with all speakers.

Cure proportion model – estimation

Numerous parametric and nonparametric estimates of relevant quantities: Cantor and Shuster (1992), Maller and Zhou (1992), Maller and Zhou (1996), Tsodikov et al. (2003).

Obvious nonparametric estimate of p, with \widehat{S} Kaplan-Meier:

- $\widehat{S}(t_0)$ for some $t_0 > 0$.
- Maller and Zhou (1992): Kaplan-Meier evaluated at largest observed time, censored or event, consistently estimates p_0 under "sufficient follow-up" condition Tsodikov et al. (2003).
- Finite sample: likely not use latest observed time to evaluate the Kaplan-Meier estimate at. Rather trade-off bias to reduce variability of estimate.
- \bullet Choose milestone t_0 where clinically, cure seems very plausible.

Kaspar Rufibach et al. MIRROS Conclusions 41 / 42

Why two models?

We have two models:

- Cure proportion model to derive sample size,
- mechanistic simulation model to explore interim operating characteristics.

Why?

Reasons:

- Futility interim analysis has no implication on type I error ⇒ independent of key design characteristic.
- Cure proportion model:
 - Simple.
 - · depends on less assumptions than mechanistic model,
 - Robust model to plan sample size.
- Mechanistic simulation model:
 - Interim setup has potential to be changed before or while study is running. Prefer not to have these
 changes interfere with sample size.
 - Only used for (internal) decision-making via iDMC, no filing relevance ⇒ can "afford" more modeling.

Kaspar Rufibach et al. MIRROS Conclusions 42 / 42
